

Salary Prediction Project - README

This project builds a machine learning model to predict salaries based on various features such as job title, experience, education level, company size, and location.

Dataset:

The dataset includes features like Years of Experience, Education Level, Skills Count, Job Title, Industry, Company Size, Location, Remote Work, and Certifications.

Data Preprocessing:

Categorical variables were converted into numerical form using one-hot encoding. This allows the model to understand non-numeric data.

Model:

A Random Forest Regressor was used to train the model. This algorithm builds multiple decision trees and combines their outputs for better predictions.

Evaluation:

The model was evaluated using R^2 , Mean Absolute Error (MAE), and Mean Squared Error (MSE). The results showed strong performance with high accuracy.

Conclusion:

The model successfully predicts salaries based on the given features. Future improvements could include more data and additional features for better generalization.
